## **CLAIMS**

Having thus described the invention, what is claimed as new and desired to be secured by Letters Patent is as follows:

1. A patient lifting apparatus, comprising:

1

1

support structure to the bed frame leg.

2 an upright member; 3 a boom mechanically associated with said upright member for conveying a patient from one location to another; and 5 a support structure for attaching said upright member to a bed frame, said support structure being arranged to transfer torque from the lifting 6 7 apparatus to the bed frame during operation. 1 2. The patient lifting apparatus according to claim 1, wherein said support structure comprises a lower attachment point that fastens to a leg of the bed frame. 2 1 3. The patient lifting apparatus according to claim 2, wherein said support structure comprises an upper attachment point that fastens to a headboard of the bed 2 3 frame.

4. The patient lifting apparatus according to claim 2, wherein said lower

attachment point comprises a plurality of threaded fasteners arranged to clamp the

- 5. The patient lifting apparatus according to claim 1, wherein said support structure comprises a lower support bar that extends across the bed frame and has each of its ends fastened to a respective leg of the bed frame.
- 6. The patient lifting apparatus according to claim 5, further comprising a telescoping foot member that extends from the lower support bar and is movable between a stored position and an extended position for stabilizing the apparatus during use.
- 7. The patient lifting apparatus according to claim 5, wherein said support structure further comprises an upper support bar that extends across the bed frame and has each of its ends fastened to a respective side of the headboard of the bed frame.
  - 8. The patient lifting apparatus according to claim 7, wherein said upper support bar comprises a pair of clamps positioned at respective ends thereof for engaging the respective sides of the headboard of the bed frame.

9. The patient lifting apparatus according to claim 1, wherein said support structure comprises an upper bearing that allows smooth rotation of the upright member relative to the bed frame, and a lower bearing that transfers the vertical force of a patient's weight into the bed frame.

- 10. The patient lifting apparatus according to claim 1, further comprising a 2 support arm mechanically associated with the upright member that rotates along with 3 the boom and engages a floor to transfer the vertical force of a patient's weight into
- 4 the floor.
- 1 11. The patient lifting apparatus according to claim 1, wherein said boom is 2 pivotally mounted to said upright member for rotation about a generally horizontal 3 axis, and further comprising a linear actuator connected between said upright member 4 and said boom for raising and lowering said boom.
- 1 12. The patient lifting apparatus according to claim 1, wherein said upright
  2 member is pivotal about a vertical axis, and further comprising an actuator for rotating
  3 the upright member about said vertical axis to swing said boom in a side-to-side
  4 movement.
- 1 13. The patient lifting apparatus according to claim 1, wherein said boom is 2 rigidly mounted to said upright member, and further comprising a winch having a 3 cable that hangs from a free end of said boom for lifting a patient.

- 14. In combination, a bed frame and a patient lifting apparatus, said bed frame comprising a plurality of legs and a headboard, said patient lifting apparatus comprising:
- 4 an upright member;

- a boom mechanically associated with said upright member for conveying a

  patient from one location to another; and
- a support structure having an upper attachment system that secures the upright
  member to the headboard, and a lower attachment system that secures the
  upright member to at least one of the legs, said support structure being
  arranged to transfer torque from the lifting apparatus into the bed frame
  during operation.
  - 15. The patient lifting apparatus according to claim 14, wherein said lower attachment system of the support structure comprises a lower support bar that extends across the bed frame and has each of its ends fastened to a respective leg of the bed frame.
- 1 16. The patient lifting apparatus according to claim 15, further comprising a 2 telescoping foot member that extends from the lower support bar and is movable 3 between a stored position and an extended position for stabilizing the apparatus 4 during use.

- 17. The patient lifting apparatus according to claim 14, wherein said upper attachment system of the support structure comprises an upper support bar that extends across the bed frame and has each of its ends fastened to a respective side of the headboard of the bed frame.
- 1 18. The patient lifting apparatus according to claim 14, wherein said upper attachment system comprises an upper bearing that allows smooth rotation of the upright member relative to the bed frame, and said lower attachment system comprises a lower bearing that transfers the vertical force of a patient's weight into the bed frame.
  - 19. The patient lifting apparatus according to claim 14, further comprising a support arm mechanically associated with the upright member that rotates along with the boom about a generally vertical axis and engages a floor on which the bed is supported to transfer the vertical force of a patient's weight into the floor via the support arm rather than via the bed frame.

1	20. A patient lifting apparatus, comprising:
2	an upright member having upper and lower ends, said upright member being
3	pivotal about a vertical axis;
4	a boom means mechanically associated with said upright member for lifting
5	and conveying a patient from one location to another; and
6	a support means for attaching said upright member to a bed frame, said
7	support means being arranged to transfer torque from the upright membe
8	into the bed frame during operation.
